

This system allows the control of daily water consumption by the horse due to a cistern mounted above the water trough linked to HippoVision.

Daily consumption can be compared to normal consumption over the preceding weeks or months to check the frequency and volume of water drunk and give an early indication of the comportment of the horse.

All is visible on screen through a table or graphic, horse by horse and can give an overview of the effectiveness of your stable.

Coupled with HippoMeal, you can programme the restriction of water supply several minutes before a meal and re-establish it afterwards. On race days the time and quantity of water and food consumption can be easily regulated.

A maximum daily volume of water supply can be programmed with a defined time for the return to zero.

All the information is collected and stored in the HippoVision programme which with HippoMeal allows the restriction of water or not during meals.

- Why choose  **HippoWater**
 - ✓ Know the exact consumption of water by your horse.
 - ✓ Cutting water before meals programmed through HippoVision avoids the effect of flushing the stomach.
 - ✓ Re-permit the supply of water after meals and for those meals programmed using HippoVision in line with the set parameters.
 - ✓ Total daily water consumption.
 - ✓ Programme the restriction of water before a race.
 - ✓ Control the maximum amount of water available per day.
 - ✓ Visualize and store individual horse water consumption data.
 - ✓ Compare consumption between all horses of the stable.
 - ✓ Detect over or under water consumption relating to the health of the horse.
